Executive Determination

DETERMINATION: AERODYNAMIC FORCES EXONERATED

Mathematical analysis of 18 ambient wind scenarios found no configuration capable of producing the observed 57-degree attitude excursion at the recorded crash coordinates, given the structural geometry of the area.

The physics engine has isolated the failure cause to mechanical, electrical (ESC/Motor), or pilot error. The ambient environment is mathematically cleared of contributing to this crash.

Wind-Vector Back-Propagation Sweep

To determine if wind caused the crash, the engine swept all possible wind directions (0° to 340°) and ran a fluid dynamics simulation over the exact building geometry extracted from OpenStreetMap. The resulting vorticity was cross-referenced against the timestamps where the drone lost control.
